

Figure 1 displays the fraction of simulated supernovae in different categories (SSE, rapid SN, fiducial, etc.) for various simulation codes (COMPAS, StarTrack, COSMIC, METISSE BOOST, METISSE MESA, MESA no MLT++). The x-axis represents the fraction (0.0 to 1.0). The right panel shows the merger rate density $\mathcal{R}_m$ [Gpc⁻³yr⁻¹] on a logarithmic scale (10⁰ to 10³). The y-axis is the same as the left panel. A vertical grey shaded region indicates the range of $\mathcal{R}_m$ values for the fiducial case.
