

Figure 1 displays the fraction of simulated supernovae detected by LSST across various simulation setups. The main plot is a horizontal bar chart where the x-axis represents the 'fraction' (0.0 to 1.0). The y-axis lists simulation parameters and codes. The bars are color-coded: orange for fiducial, blue for various parameter variations, green for different SN types, and red for specific models. To the right of the bars is a vertical scatter plot showing the detection rate $\mathcal{R}_m$ [Gpc⁻³ yr⁻¹] on a logarithmic scale from 10¹ to 10². The scatter plot shows black diamonds representing the detection rate for each simulation setup, with a grey shaded region indicating the range of detection rates.
