MB

Hi Floor,

I certainly do. Below are the rates om $\text{Gpc}^{-3} \text{ yr}^{-1}$ at $z=0$.
I've also attached the detailed output.

DELAYED:

total:	48.0	
SMT+CEE:	16.98	35.35%
SMT+SMT:	5.22	10.88%
CEE+SMT:	0.62	1.29%
CEE+CEE:	21.94	45.69%
SMT+NON:	1.42	2.97%
CEE+NON:	1.06	2.20%
NON+SMT:	0.16	0.32%
NON+CEE:	0.41	0.85%
NON+NON:	0.22	0.45%

RAPID

total:	57.1	
SMT+CEE:	23.58	41.29%
SMT+SMT:	5.56	9.73%
CEE+SMT:	0.50	0.88%
CEE+CEE:	24.00	42.00%
SMT+NON:	1.40	2.45%
CEE+NON:	1.25	2.19%
NON+SMT:	0.20	0.34%
NON+CEE:	0.48	0.84%
NON+NON:	0.16	0.28%

Cheers,
Max

Subject: question regarding your 2022 paper

Hi Max,

I hope that you are doing well. I was re-reading your paper again and have a question:

In Section 5.2.1. you discuss the effect from changing remnant mass prescriptions, particularly by implementing the rapid & delayed rate.

Do you by any chance have for these two models (delayed and rapid SNe) for me the following numbers:

following numbers.

- the total intrinsic rate at redshift 0 (similar to $6.5 \text{ Gpc}^3 \text{ yr}^{-1}$ for the fiducial model)
- the contribution from the channels as provided in Figure 5?

That would be really useful for us to add to the review as well as for a current paper I am working on.

Thank you,

Floor
